■ Enzyme solution

Weigh about 20 mg of test sample exactly and add enzyme dilution buffer to make a total of 20 ml. Dilute it with enzyme dilution buffer to adjust the concentration as required.

■ Procedure

- Pipette 0.45 ml of reaction mixture for the first reaction into a small test tube and preincubate them at 37°C.
- After 5 min, add exactly 50 μl of enzyme solution and mix to start the first reaction.

※ In the case of a test blank, add 50 μl of enzyme dilution buffer in place of enzyme solution at this point.

- After 10 min, add 0.50 ml of reaction stopper and mix. On stopping the first reaction, add 0.50 ml of the reaction mixture for the second reaction immediately to start the second reaction at 37°C.
- After 20 min, add 1.5 ml of reaction dilution solution and mix.
- After 10 min, measure the absorbance at 500 nm.

Absorbance	sample : As/min
	blank : Ab/min

$$\Delta A/\text{min} = (As/\text{min} - Ab/\text{min}) \leq 0.40 \text{ Abs/min}$$

■ Calculation

$$\text{Activity (U/mg)} = \frac{\Delta A/10}{12.2 \times 1/2} \times \frac{1}{2} \times \frac{3.00}{0.05} \times \frac{1}{X}$$

12.2 : millimolar extinction coefficient of quinoneimine dye at 500 nm (cm² / μmole)

2 : the multiplier derived from the fact that 1 mole of phosphatidyl choline produces 2 mole of H₂O₂

1/2 : the multiplier derived from the fact that 2 mole of H₂O₂ produces 1 mole of quinoneimine dye

10 : reaction time (min)

3.00 : final volume (ml)

0.05 : volume of enzyme solution (ml)

X : concentration of the sample in enzyme solution (mg/ml)

Storage

Storage at -20°C in the presence of a desiccant is recommended. Enzyme activity will be retained for at least one year under this condition (Figure 3).
