The assay is based on the decrease in absorbance at 340 nm of NADH in the following reaction

Unit definition

One unit is defined as the amount of enzyme which converts 1 μ mole of fructose-6-phosphate to Fructose-1,6 - biphosphat per minute at 37°C under the conditions specified in the assay procedure.

Enzyme solution

Accurately weigh about 10 mg of the sample and add enzyme dilution buffer to make a total of 10 ml. Dilute it with enzyme dilution buffer to adjust the concentration to 5.0-10.0 U/ml.

Procedure

- Pipette accurately 3.0 ml of reaction mixture into a small test tube and preincubate at 30°C.
- After 5 min add accurately 10 μ l of enzyme solution and mix to start the reaction at 30°C.
* In the case of a test blank, add 10 μ l of enzyme diluti on buffer in place of enzyme solution.
- After starting the reaction, measure the rate of decrease per minutes in absorbance at 340 nm. The rate must be measured within the linear portion of the absorbance curve. (Ex. Linear range from 2 min to 5 min)

Absorbance sample : As/min

blank : Ab/min

$\Delta A/\text{min} = (A_s/\text{min} - A_b/\text{min}) \leq 0.25 \text{ Abs}/\text{min}$

■ Calculation

$$\text{Activity (U/mg of powder)} = \frac{\Delta A/\text{min.}}{6.22} \times \frac{3.01}{0.01} \times \frac{1}{X}$$

$$= \Delta A/\text{min.} \times 48.39 \div X$$

6.22 : millimolar extinction coefficient of NADPH at 340nm
($\text{cm}^2/\mu\text{mol}$)

3.01 : final volume (ml)

0.01 : volume of enzyme solution (ml)

X : concentration of the sample in enzyme solution
(mg/ml)

Storage

Storage at -20°C in the presence of a desiccant is recommended.
